Splitter Windows Test

Test package `splitter-0.2.0-fixes-PR1-910df64-windows-x64.zip` (built by CI run 40563919244; it still says 0.2.0 inside) · for pull request #1 of github.com/LudaLunizz/Splitter · about 1½ hours plus a long run

How to fill it in: for every row write **OK**, **FAIL** or **skipped** in the right column. On a FAIL, write down what you saw (the exact error text, or a photo of the screen) and carry on with the next row if you can. "Expect" says what should happen.

Before you start

0.1	The PC runs **Windows 10 version 2004 or later, or Windows 11**, 64-bit, with an Intel or AMD processor (Settings › System › About: "x64-based processor"). On an ARM PC, run install.cmd anyway: expect it to stop with "This PC has an ARM processor", change nothing, and end the test there.	
0.2	**Test mode is on.** Secure Boot must be off. In an administrator Command Prompt: `bcdedit /set testsigning on`, then restart. "Test Mode" shows at the bottom right of the desktop. Undo after the test: `bcdedit /set testsigning off`, restart.	
0.3	**BananaSplit 2.8.6** is installed (github.com/LudaLunizz/BananaSplit/releases).	
0.4	Write down what Splitter is installed now: **none**, the released **v0.2.0**, or **0.1.0** (in Sound settings its cables end in "(Splitter Virtual Cables)").	

A. Install

A1	**If 0.1.0 is installed:** unzip the test package and double-click `install.cmd`. Expect: "Splitter 0.1.0 is installed … run uninstall.cmd" and "Nothing was changed". Then run this package's `uninstall.cmd`, restart if it asks, and go on with A2.	
A2	Double-click `install.cmd` and allow it to make changes. Expect: "Installing Splitter (eleven cables)…" (or "updating its driver" if v0.2.0 was installed), then a list of **22 cables**, each ending in "(Splitter Cables)". **No red text**, in particular not "The property 'Count' cannot be found". If it says a restart is needed, restart and look again.	
A3	**Playback** devices (Sound settings › More sound settings › Playback): **Splitter 1** to **Splitter 6**, and **Splitter A1 Input**, A2, A3, B1, B2 Input: 11 in all.	
A4	**Recording** devices: **Splitter 1 Output** to **Splitter 6 Output**, and **Splitter A1**, A2, A3, B1, B2: 11 in all. Splitter A1 to B2 show as **microphones**.	
A5	Device Manager › Sound, video and game controllers: **one** "Splitter Cables", with no yellow warning sign.	
A6	Run `install.cmd` **a second time**. Expect: "Splitter is installed already: updating its driver…", no red text, the same 22 cables, and still only one "Splitter Cables" in Device Manager.	

B. BananaSplit

B1	Start BananaSplit. The status line does **not** say "No virtual cables are installed". Menu › Virtual cables… shows Splitter with **all eleven cables** and none missing.	
B2	In each channel's menu (strips 1–6, buses A1–B2) the cable can be switched on and off.	
B3	**Strip:** play music in a browser with its output set to **Splitter 1** (Windows: Settings › Sound › Volume mixer, per app). Strip 1 in BananaSplit shows the level and you hear it clean. Repeat for **Splitter 6**.	
B4	**Bus:** send strip 1 to bus B1. In Windows' Sound Recorder (or Discord) choose the microphone **Splitter B1** and record 10 seconds. The recording plays back clean.	

C. Sound quality

C1	**Formats.** For **Splitter 1** (playback) and **Splitter 1 Output** (recording), Properties › Advanced: try **16 bit**, **24 bit** and **32 bit**, 48000 Hz, each with B3 again. Each must sound clean: no crackle, no wrong speed or pitch, no silence.	

C2	**Exclusive mode** (in the device's Properties › Advanced, "Allow applications to take exclusive control" is on): play into Splitter 1 from a player in **WASAPI exclusive** mode, e.g. foobar2000 with output "WASAPI (exclusive)". Clean sound in BananaSplit? This is the case the timing fix is for: before it, sound came out garbled.	
C3	**Another recording app:** record **Splitter 1 Output** in Audacity (host "Windows WASAPI") while music plays into Splitter 1, for one minute. Smooth, no gaps or bursts?	
C4	**Delay:** click along with a video playing into Splitter 1 while you listen through BananaSplit. Write down if the delay feels larger than a TV that's slightly out of sync (it should be about 30 ms).	
C5	**Long run:** leave music playing through Splitter 1 into BananaSplit for **at least 1 hour** (overnight is better). Afterwards: still clean, no crackle, and the sound hasn't drifted out of sync.	

D. Remove

D1	Double-click `uninstall.cmd`. Expect "Splitter is removed." (or "… Restart Windows to finish"; then restart). The Splitter cables are gone from Sound settings and Device Manager.	
D2	Run `install.cmd` again, then go over A3, A4 and B1 once more. All 22 cables are back.	
D3	BananaSplit's other cards and audio devices (speakers, headset, any VB-Audio cables) still work.	

E. Optional: Driver Verifier

Only if you are comfortable fixing a PC that blue-screens at startup. Driver Verifier makes Windows stop with a blue screen as soon as the driver does something wrong, which is the point. If Windows won't start any more: boot into Safe Mode (hold Shift while clicking Restart › Troubleshoot › Advanced › Startup Settings) and run `verifier /reset`.

E1	In an administrator Command Prompt: `verifier /standard /driver splitter.sys`, restart.	
E2	Repeat A6, B3, B4, C1 and C2, then stop and start playback a few times. No blue screen?	
E3	Turn it off: `verifier /reset`, restart.	

What to send back

- This sheet with the results column filled in, and your Windows version (Settings › System › About: edition, version, OS build).
- Photos or screenshots of the `install.cmd` window (A2, A6) and of any error.
- If installing fails: `C:\Windows\INF\setupapi.dev.log`.
- After a blue screen: the newest file in `C:\Windows\Minidump`, and the text on the blue screen (the "Stop code" and the file named).
